

String permutation Algorithm:

str \rightarrow input string aux \rightarrow for each permutation

① take ith ($i = 0$ to $(\text{size} - 1)$)

aux + str[i];

② Now aux new string will be without char i

str = str.substr(0, i) + str.substr(i+1, size);

eg: str = abc aux = "a" ~~aux~~ ~~str~~

eg:

aux
"
a
ab
abc

string
abc
b c
c
"

i
0
0
0
0

2

off

str.length() == 0

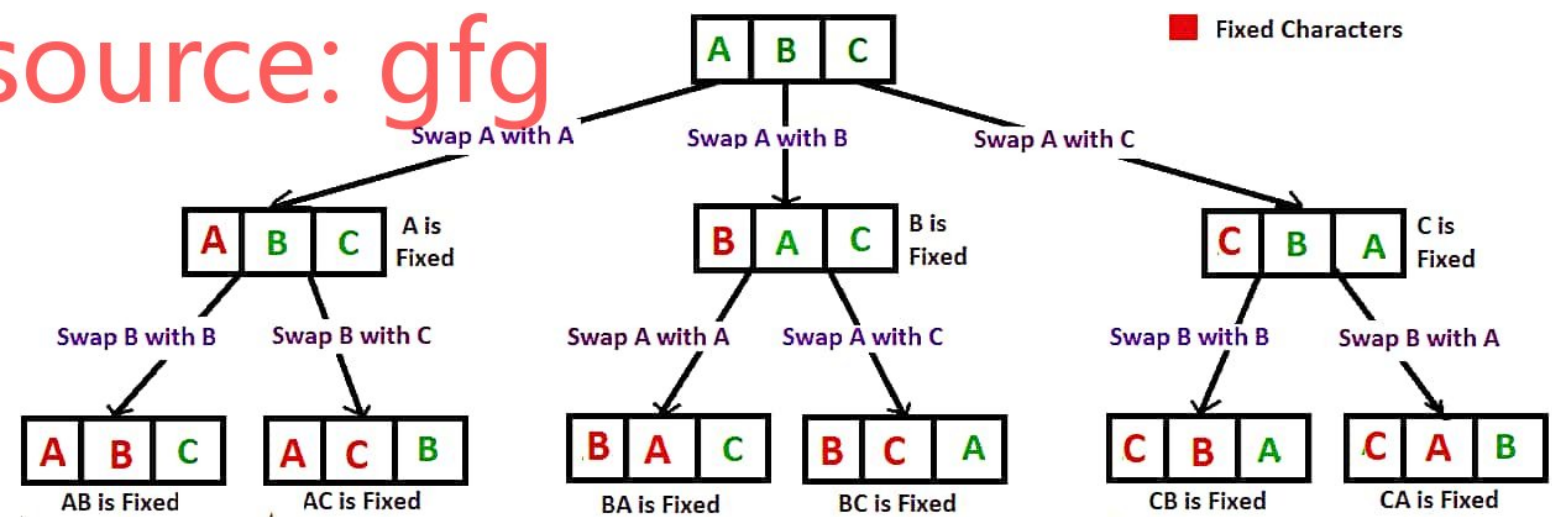

result.insert(aux);

Now i = 1

b ac
ba c
bac "a"
